

Problem 1.

- (a) Find $\int \frac{6x^3 + 2}{x^2 + 1} dx$.
- (b) Evaluate $\int_2^4 x \ln x dx$ exactly.

Solution**Part (a)**

$$\begin{aligned}
 \int \frac{6x^3 + 2}{x^2 + 1} dx &= 6 \int \frac{x^3}{x^2 + 1} dx + 2 \int \frac{1}{x^2 + 1} dx \\
 &= 6 \int \frac{x^3}{x^2 + 1} dx + 2 \arctan x + C \\
 &= 6 \int \frac{x^2}{x^2 + 1} \cdot x dx + 2 \arctan x + C \\
 &= 6 \cdot \frac{1}{2} \int \frac{u - 1}{u} du + 2 \arctan x + C \\
 &= 3 \int \left(1 - \frac{1}{u}\right) du + 2 \arctan x + C \\
 &= 3(u - \ln |u|) + 2 \arctan x + C \\
 &= 3(x^2 + 1) - \ln(x^2 + 1) + 2 \arctan x + C \\
 &= 3x^2 - \ln(x^2 + 1) + 2 \arctan x + C
 \end{aligned}$$

$$\begin{aligned}
 u &= x^2 + 1 \\
 du &= 2x dx
 \end{aligned}$$

$$\boxed{\int \frac{6x^3 + 2}{x^2 + 1} dx = 3x^2 - \ln(x^2 + 1) + 2 \arctan x + C}$$

Part (b)

Note that $\frac{d}{dx} x \ln x = x \cdot \frac{1}{x} + \ln x \cdot 1 = 1 + \ln x$.

	D	I
+	$x \ln x$	1
-	$1 + \ln x$	x

Let $I = \int x \ln x dx$.

$$\begin{aligned}
 I &= \int x \ln x dx \\
 &= x^2 \ln x - \int (x + x \ln x) dx \\
 &= x^2 \ln x - \frac{1}{2}x^2 - I
 \end{aligned}$$

$$\begin{aligned}\implies 2I &= x^2 \ln x - \frac{1}{2}x^2 + C \\ \implies I &= \frac{1}{2}x^2 \ln x - \frac{1}{4}x^2 + C\end{aligned}$$

Evaluating I from $x = 2$ to 4 ,

$$\begin{aligned}\int_2^4 x \ln x \, dx &= \left[\frac{1}{2}x^2 \ln x - \frac{1}{4}x^2 \right]_2^4 \\ &= 14 \ln 2 - 3\end{aligned}$$

$$\boxed{\int_2^4 x \ln x \, dx = 14 \ln 2 - 3}$$

Problem 2.

- (a) Use the derivative of $\cos \theta$ to show that $\frac{d}{d\theta} \sec \theta = \sec \theta \tan \theta$.
- (b) Use the substitution $x = \sec \theta - 1$ to find the exact value of $\int_{\sqrt{2}-1}^1 \frac{1}{(x+1)\sqrt{x^2+2x}} dx$.

Solution**Part (a)**

$$\begin{aligned}
 \frac{d}{d\theta} \sec \theta &= \frac{d}{d\theta} \frac{1}{\cos \theta} \\
 &= \frac{1}{\cos^2 \theta} \cdot \frac{d}{d\theta} \cos \theta \\
 &= \frac{1}{\cos^2 \theta} \cdot \sin \theta \\
 &= \frac{1}{\cos \theta} \cdot \frac{\sin \theta}{\cos \theta} \\
 &= \sec \theta \tan \theta
 \end{aligned}$$

Part (b)

Consider the substitution $x = \sec \theta - 1 \implies dx = \sec \theta \tan \theta d\theta$. When $x = 1$, we have $\theta = \frac{\pi}{3}$. When $x = \sqrt{2} - 1$, we have $\theta = \frac{\pi}{4}$. Also note that $x + 1 = \sec \theta$. Consider $x^2 + 2x$.

$$\begin{aligned}
 x^2 + 2x &= (\sec \theta - 1)^2 + 2(\sec \theta - 1) \\
 &= \sec^2 \theta - 2 \sec \theta + 1 + 2 \sec \theta - 2 \\
 &= \sec^2 \theta - 1 \\
 &= \tan^2 \theta
 \end{aligned}$$

Hence, $\sqrt{x^2 + 2x} = \tan \theta$. Hence,

$$\begin{aligned}
 \int_{\sqrt{2}-1}^1 \frac{1}{(x+1)\sqrt{x^2+2x}} dx &= \int_{\frac{\pi}{4}}^{\frac{\pi}{3}} \frac{\sec \theta \tan \theta}{\sec \theta \tan \theta} d\theta \\
 &= \int_{\frac{\pi}{4}}^{\frac{\pi}{3}} d\theta \\
 &= \frac{\pi}{3} - \frac{\pi}{4} \\
 &= \frac{\pi}{12}
 \end{aligned}$$

$$\boxed{\int_{\sqrt{2}-1}^1 \frac{1}{(x+1)\sqrt{x^2+2x}} dx = \frac{\pi}{12}}$$

Problem 3.

The expression $\frac{x^2}{9-x^2}$ can be written in the form $A + \frac{B}{3-x} + \frac{C}{3+x}$.

(a) Find the values of constants A , B and C .

(b) Show that $\int_0^2 \frac{x^2}{9-x^2} dx = \frac{3}{2} \ln 5 - 2$.

(c) Hence, find the value of $\int_0^2 \ln(9-x^2) dx$, giving your answer in terms of $\ln 5$.

Solution**Part (a)**

$$\begin{aligned} \frac{x^2}{9-x^2} &= \frac{-(9-x^2)+9}{9-x^2} \\ &= -1 + \frac{9}{9-x^2} \\ &= -1 + \frac{9}{(3-x)(3+x)} \\ &= -1 + \frac{9/6}{3-x} + \frac{9/6}{3+x} \\ &= -1 + \frac{3/2}{3-x} + \frac{3/2}{3+x} \end{aligned}$$

$A = -1, B = \frac{3}{2}, C = \frac{3}{2}$
--

Part (b)

$$\begin{aligned} \int_0^2 \frac{x^2}{9-x^2} dx &= \int_0^2 \left(-1 + \frac{3/2}{3-x} + \frac{3/2}{3+x} \right) dx \\ &= \left[-x - \frac{3}{2} \ln(3-x) + \frac{3}{2} \ln(3+x) \right]_0^2 \\ &= \frac{3}{2} \ln 5 - 2 \end{aligned}$$

Part (c)

	D	I
+	$\ln(9-x^2)$	1
-	$\frac{2x}{9-x^2}$	x

$$\begin{aligned}\int_0^2 \ln(9 - x^2) \, dx &= [x \ln(9 - x^2)]_0^2 + 2 \int_0^2 \frac{x^2}{9 - x^2} \, dx \\ &= 2 \ln 5 + 2 \left(\frac{3}{2} \ln 5 - 2 \right) \\ &= 5 \ln 5 - 4\end{aligned}$$

$$\boxed{\int_0^2 \ln(9 - x^2) \, dx = 5 \ln 5 - 4}$$
