# Problem 1.

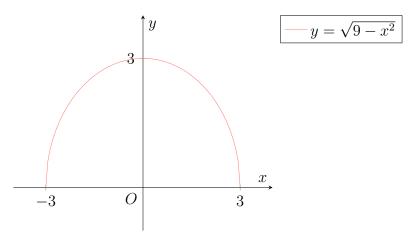

Sketch the following graphs and determine whether each graph represents a function for the given domain.

(a) 
$$y = \sqrt{9 - x^2}, -3 \le x \le 3$$

(b) 
$$x = (y - 4)^2, y \in \mathbb{R}$$

# Solution

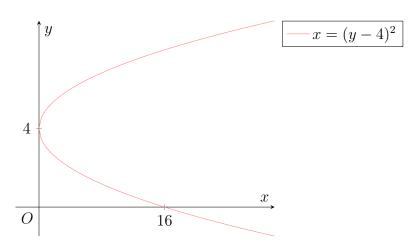

### Part (a)

 $y = \sqrt{9 - x^2}$  passes the vertical line test for  $-3 \le x \le 3$  and is hence a function.

$$y = \sqrt{9 - x^2}$$
,  $-3 \le x \le 3$  is a function.

#### Part (b)

 $x=(y-4)^2$  does not pass the vertical line test for  $y\in\mathbb{R}$  and is hence not a function.

$$x = (y-4)^2, y \in \mathbb{R}$$
 is not a function.

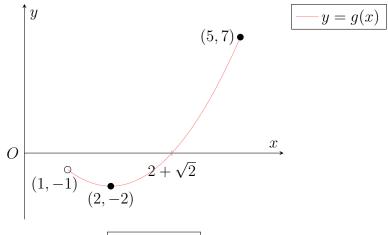

# Problem 2.

Sketch the graph and find the range for each the following functions.

- (a)  $g: x \mapsto x^2 4x + 2, 1 < x \le 5$
- (b)  $h: x \mapsto |2x 3|, x < 3$

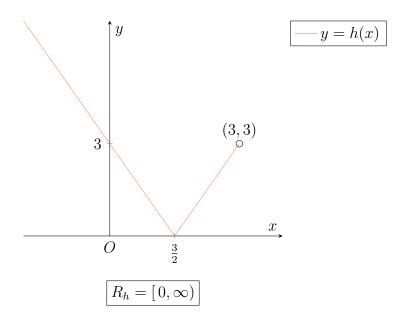

# Solution

# Part (a)

$$R_g = [-2, 7)$$

# Part (b)

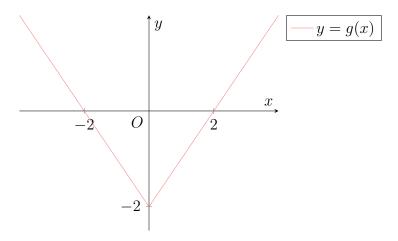

# Problem 3.

For each of the following functions, sketch its graph and determine if the function is one-one. If it is, find its inverse in a similar form.

- (a)  $g: x \mapsto |x| 2, x \in \mathbb{R}$
- (b)  $h: x \mapsto x^2 + 2x + 5, x \le -2$

# Solution

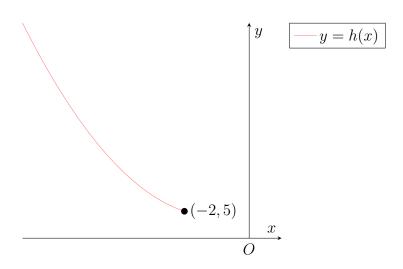

## Part (a)

y = g(x) does not pass the horizontal line test. Hence, g is not one-one.

$$g$$
 is not one-one.

Part (b)

y = h(x) passes the horizontal line test. Hence, h is one-one.

$$h$$
 is not one-one.

Note that  $y = h(x) \implies x = h^{-1}(y)$ . Now consider y = h(x).

$$y = h(x)$$

$$\Rightarrow y = x^2 + 2x + 5$$

$$\Rightarrow y = x^2 + 2x + 1 + 4$$

$$\Rightarrow y = (x+1)^2 + 4$$

$$\Rightarrow (x+1)^2 = y - 4$$

$$\Rightarrow x + 1 = \pm \sqrt{y-4}$$

Now, since  $x \leq -2$ , we have  $x+1 \leq -1$ . Hence, we reject  $x+1 = \sqrt{y-4}$  since  $\sqrt{y-4} \geq 0$ .

$$\implies x + 1 = -\sqrt{y - 4}$$

$$\implies x = -1 - \sqrt{y - 4}$$

Hence,  $h^{-1}(x) = -1 - \sqrt{x-4}$ . Note that  $D_{h^{-1}} = R_h = [5, \infty)$ . Hence,

$$h^{-1} \colon x \mapsto -1 - \sqrt{x-4}, \ x \ge 5$$

# Problem 4.

The function f is defined by

$$f \colon x \mapsto x + \frac{1}{x}, \ x \neq 0$$

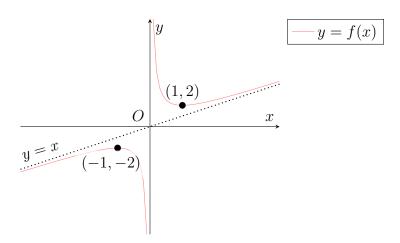

- (a) Sketch the graph of f and explain why  $f^{-1}$  does not exist.
- (b) The function h is defined by  $h: x \mapsto f(x), x \in \mathbb{R}, x \geq \alpha$ , where  $\alpha \in \mathbb{R}^+$ . Find the smallest value of  $\alpha$  such that the inverse function of h exists.

Using this value of  $\alpha$ ,

- (c) State the range of h.
- (d) Express  $h^{-1}$  in a similar form and sketch on a single diagram, the graphs of h and  $h^{-1}$ , showing clearly their geometrical relationship.

#### Solution

### Part (a)

y = f(x) does not pass the horizontal line test. Hence, f is not one-one. Hence,  $f^{-1}$  does not exist.

#### Part (b)

Consider f'(x) = 0 for x > 0.

$$f'(x) = 0$$

$$\Rightarrow 1 - \frac{1}{x^2} = 0$$

$$\Rightarrow x^2 = 1$$

$$\Rightarrow x = 1 \quad (rej. \ x = -1 : x > 0)$$

Looking at the graph of y = f(x), we see that f(x) achieves a minimum at x = 1. Hence, f is increasing for all  $x \ge 1$ . Thus, the smallest value of  $\alpha$  is 1.

$$\min \alpha = 1$$

Note f(1) = 2. Hence, from the graph,

$$R_h = [2, \infty)$$

Tutorial B3

**Functions** 

### Part (d)

Note that  $y = h(x) \implies x = h^{-1}(y)$ . Now consider y = h(x).

$$y = h(x)$$

$$\Rightarrow \qquad y = x + \frac{1}{x}$$

$$\Rightarrow \qquad xy = x^2 + 1$$

$$\Rightarrow x^2 - yx + 1 = 0$$

$$\Rightarrow \qquad x = \frac{1}{2}(y \pm \sqrt{y^2 - 4})$$

Note that  $f(2) = \frac{5}{2}$ . Since  $2 = \frac{1}{2} \left( \frac{5}{2} + \sqrt{\left( \frac{5}{2} \right)^2 - 4} \right)$  and  $2 \neq \frac{1}{2} \left( \frac{5}{2} - \sqrt{\left( \frac{5}{2} \right)^2 - 4} \right)$ , we reject  $x = \frac{1}{2} (y - \sqrt{y^2 - 4})$ . Hence,  $h^{-1}(x) = \frac{1}{2} (x + \sqrt{x^2 - 4})$ . Note that  $D_{f^{-1}} = R_f = [2, \infty)$ . Thus,

$$h^{-1}: x \mapsto \frac{1}{2} (x + \sqrt{x^2 - 4}), x \ge 2$$

# Problem 5.

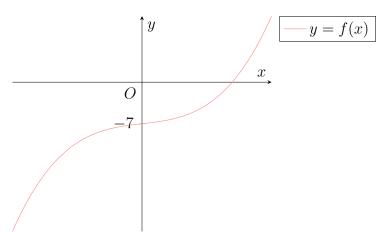

The function f is defined as follows:

$$f: x \mapsto x^3 + x - 7, x \in \mathbb{R}$$

- (a) By using a graphical method or otherwise, show that the inverse of f exists.
- (b) Solve exactly the equation  $f^{-1}(x) = 0$ . Sketch the graph of  $f^{-1}$  together with the graph of f on the same diagram.
- (c) Find, in exact form, the coordinates of the intersection point(s) of the graphs of f and  $f^{-1}$ .
- (d) Given that the gradient of the tangent to the curve with equation  $y = f^{-1}(x)$  is  $\frac{1}{4}$  at the point with x = p, find the possible values of p.

# Solution

### Part (a)

y = f(x) passes the horizontal line test. Hence, f is one-one. Thus,  $f^{-1}$  exists.

#### Part (b)

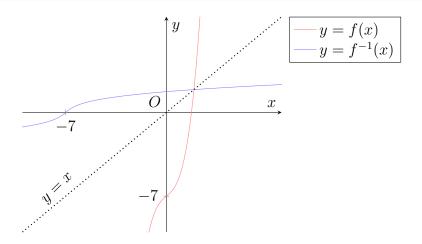

$$f^{-1}(x) = 0$$

$$\implies x = f(0)$$

$$\implies x = 0^{3} + 0 - 7$$

$$= -7$$

$$\boxed{x = -7}$$

Let  $(\alpha, \beta)$  be the coordinates of the intersection between f(x) and  $f^{-1}$ . From the graph, we see that  $\alpha = \beta$ , hence  $f(\alpha) = \alpha$ .

$$f(\alpha) = \alpha$$

$$\Rightarrow \alpha^3 + \alpha - 7 = \alpha$$

$$\Rightarrow \alpha^3 = 7$$

$$\Rightarrow \alpha = \sqrt[3]{7}$$

$$(\sqrt[3]{7}, \sqrt[3]{7})$$

### Part (d)

$$[f^{-1}(x)]' = \frac{1}{f'(f^{-1}(x))}$$

$$\Longrightarrow |f^{-1}(x)|'|_{x=p} = \frac{1}{f'(f^{-1}(x))}\Big|_{x=p}$$

$$\Longrightarrow \frac{1}{4} = \frac{1}{f'(f^{-1}(x))}\Big|_{x=p}$$

$$\Longrightarrow evalder f'(f^{-1}(x))x = p = 4$$

Note that  $f'(x) = 3x^2 + 1$ .

$$\implies (3f^{-1}(x)^2 + 1)\big|_{x=p} = 4$$

$$\implies 3f^{-1}(p)^2 + 1 = 4$$

$$\implies f^{-1}(p)^2 = 1$$

$$\implies f^{-1}(p) = \pm 1$$

Case 1:  $f^{-1}(p) = 1$ 

$$f^{-1}(p) = 1$$

$$\implies p = f(1)$$

$$\implies p = 1^{3} + 1 - 7$$

$$= -5$$

Case 2:  $f^{-1}(p) = -1$ 

$$f^{-1}(p) = -1$$

$$\implies p = f(-1)$$

$$\implies p = (-1)^3 - 1 - 7$$

$$= -9$$

$$p = -9 \lor -5$$

# Problem 6.

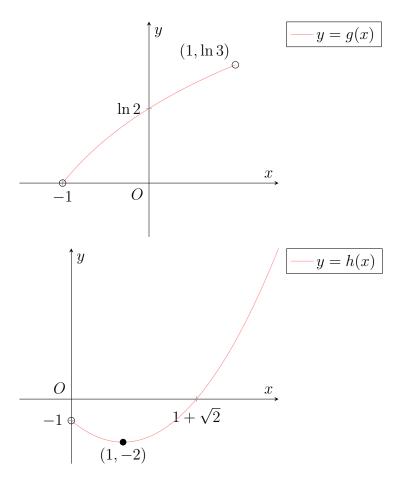

The functions g and h are defined as follows:

$$g: x \mapsto \ln(x+2),$$
  $x \in (-1,1)$   
 $h: x \mapsto x^2 - 2x - 1,$   $x \in \mathbb{R}^+$ 

- (a) Sketch, on separate diagrams, the graphs of g and h.
- (b) Determine whether the composite function gh exists.
- (c) Give the rule and domain of the composite function hg and find its range.
- (d) The image of a under the composite function hg is -1.5. Find the value of a.

# Solution

### Part (a)

### Part (b)

Observe that  $R_h = [-2, \infty)$  and  $D_g = (-1, 1)$ . Hence,  $R_h \nsubseteq D_g$ . Thus, gh does not exist.

gh does not exist.

$$hg(x) = h(\ln(x+2))$$
  
=  $\ln(x+2)^2 - 2\ln(x+2) - 1$ 

Tutorial B3

**Functions** 

Note that  $D_{hg} = D_g = (-1, 1)$ .

$$hg: x \mapsto \ln(x+2)^2 - 2\ln(x+2) - 1, x \in (-1,1)$$

Observe that h is decreasing on the interval (0,1] and increasing on the interval  $[1,\infty)$ . Note that  $R_g = (0, \ln 3)$ . Hence,

$$R_{hg} = [-2, \max\{h(0), h(\ln 3)\})$$
  
= [-2, -1)

# Part (d)

Note that  $h(x) = (x-1)^2 - 2$ . Hence,  $h^{-1}(x) = 1 + \sqrt{x+2}$  (we reject  $h^{-1}(x) = 1 - \sqrt{x+2}$  since  $R_{h^{-1}} = D_h = \mathbb{R}^+$ ). Also note that  $g^{-1} = e^x - 2$ .

$$hg(a) = -1.5$$

$$\Rightarrow g(a) = h^{-1}(-1.5)$$

$$= 1 + \sqrt{-1.5 + 2}$$

$$= 1 + \frac{1}{\sqrt{2}}$$

$$\Rightarrow a = g^{-1}\left(1 + \frac{1}{\sqrt{2}}\right)$$

$$= e^{1 + \frac{1}{\sqrt{2}}} - 2$$

$$\boxed{a = e^{1 + \frac{1}{\sqrt{2}}} - 2}$$

# Problem 7.

The functions f and g are defined as follows:

$$f \colon x \mapsto 3 - x, \qquad x \in \mathbb{R}$$
$$g \colon x \mapsto \frac{4}{x}, \qquad x \in \mathbb{R}, \ x \neq 0$$

Tutorial B3

**Functions** 

- (a) Show that the composite function fg exists and express the definition of fg in a similar form. Find the range of fg.
- (b) Find, in similar form,  $g^2$  and  $g^3$ , and deduce  $g^{2017}$ .
- (c) Find the set of values of x for which  $g(x) = g^{-1}(x)$ .

# Solution

#### Part (a)

Note that  $R_g = \mathbb{R} \setminus \{0\}$  and  $D_g = \mathbb{R}$ . Hence,  $R_g \subseteq D_g$ . Thus, fg exists.

$$fg(x) = f\left(\frac{4}{x}\right)$$
$$= 3 - \frac{4}{x}$$

Observe that  $D_{fg} = D_g = \mathbb{R} \setminus \{0\}.$ 

$$\boxed{fg\colon x\mapsto 3-\frac{4}{x},\,x\in\mathbb{R}\setminus\{0\}}$$

Since  $\frac{4}{x}$  can take on any value except 0, then  $fg(x) = 3 - \frac{4}{x}$  can take on any value except 3.

$$R_{fg} = \mathbb{R} \setminus \{3\}$$

#### Part (b)

$$g^{2}(x) = g\left(\frac{4}{x}\right)$$
$$= \frac{4}{\frac{4}{x}}$$
$$= x$$

$$g^2 \colon x \mapsto x, \, x \in \mathbb{R} \setminus \{0\}$$

$$g^{3}(x) = g(g^{2}(x))$$

$$= g(x)$$

$$= \frac{4}{x}$$

$$g^3 \colon x \mapsto \frac{4}{x}, \ x \in \mathbb{R} \setminus \{0\}$$

$$g^{2017} = g^{2016}(g(x))$$

$$= (g^2)^{1008}(g(x))$$

$$= g(x)$$

$$= \frac{4}{x}$$

$$g^{2017} \colon x \mapsto \frac{4}{x}, \ x \in \mathbb{R} \setminus \{0\}$$

$$g(x) = g^{-1}(x)$$
$$\implies g^{2}(x) = x$$

From the definition of  $g^2(x)$ , we know that  $g^2(x) = x$  for all x in  $D_{g^2}$ .

$$\mathbb{R}\setminus\{0\}$$

# Problem 8.

The function f is defined by

$$f(x) = \begin{cases} 2x+1, & 0 \le x < 2\\ (x-4)^2 + 1, & 2 \le x < 4 \end{cases}$$

It is further given that f(x) = f(x+4) for all real values of x.

- (a) Find the values of f(1) and f(5) and hence explain why f is not one-one.
- (b) Sketch the graph of y = f(x) for  $-4 \le x < 8$ .
- (c) Find the range of f for  $-4 \le x < 8$ .

# Solution

## Part (a)

$$f(1) = 2(1) + 1$$

$$= 3$$

$$f(5) = f(1 + 4)$$

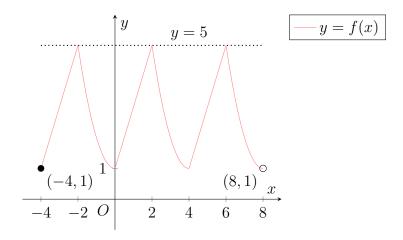

$$= f(1)$$

$$= 3$$

$$f(1) = 3, f(5) = 3$$

Since f(1) = f(5), but  $1 \neq 5$ , f is not one-one.

#### Part (b)

Part (c)

$$R_f = [1, 5]$$

2024-03-18

Problem 9.

(a) The function f is given by  $f: x \mapsto 1 + \sqrt{x}$  for  $x \in \mathbb{R}^+$ .

- (i) Find  $f^{-1}(x)$  and state the domain of  $f^{-1}$ .
- (ii) Find  $f^2(x)$  and the range of  $f^2$ .
- (iii) Show that if  $f^2(x) = x$  then  $x^3 4x^2 + 4x 1 = 0$ . Hence, find the value of x for which  $f^2(x) = x$ . Explain why this value of x satisfies the equation  $f(x) = f^{-1}(x)$ .
- (b) The function g, with domain the set of non-negative integers, is given by

$$g(n) = \begin{cases} 1, & n = 0 \\ 2 + g\left(\frac{1}{2}n\right), & n \text{ even} \\ 1 + g(n-1), & n \text{ odd} \end{cases}$$

- (i) Find g(4), g(7) and g(12).
- (ii) Does g have an inverse? Justify your answer.

Solution

Part (a)

Subpart (i)

Let y = f(x). Then  $x = f^{-1}(y)$ .

$$y = f(x)$$

$$\implies y = 1 + \sqrt{x}$$

$$\implies \sqrt{x} = y - 1$$

$$\implies x = (y - 1)^{2}$$

$$f^{-1}(x) = (x - 1)^{2}$$

Observe that  $D_{f^{-1}} = R_f = (1, \infty)$ .

$$D_{f^{-1}} = (1, \infty)$$

Subpart (ii)

$$f^{2}(x) = f(1 + \sqrt{x})$$
$$= 1 + \sqrt{1 + \sqrt{x}}$$

$$f^2(x) = 1 + \sqrt{1 + \sqrt{x}}$$

Observe that  $\sqrt{1+\sqrt{x}} > 1$ . Hence,  $1 + \sqrt{1+\sqrt{x}} > 1 + 1 = 2$ .

$$R_{f^2}=(2,\infty)$$

#### Subpart (iii)

$$f^{2}(x) = x$$

$$\Rightarrow 1 + \sqrt{1 + \sqrt{x}} = x$$

$$\Rightarrow \sqrt{1 + \sqrt{x}} = x - 1$$

$$\Rightarrow 1 + \sqrt{x} = (x - 1)^{2}$$

$$\Rightarrow \sqrt{x} = (x - 1)^{2} - 1$$

$$\Rightarrow = x(x - 2)$$

$$\Rightarrow x = (x(x - 2))^{2}$$

$$\Rightarrow x(x - 2)^{2} = 1 \quad (\because x \neq 0)$$

$$\Rightarrow x (x^{2} - 4x + 4) = 1$$

$$\Rightarrow x^{3} - 4x^{2} + 4x = 1$$

$$\Rightarrow x^{3} - 4x^{2} + 4x - 1 = 0$$

Hence, if  $f^2(x) = x$ , then  $x^3 - 4x^2 + 4x - 1 = 0$ .

$$f^{2}(x) = x$$

$$\implies x^{3} - 4x^{2} + 4x - 1 = 0$$

$$\implies (x - 1)(x^{2} - 3x + 1) = 0$$

Hence, x = 1 or  $(x^2 - 3x + 1) = 0$ . However, since  $x \ge 2$ , x cannot be 1. We thus consider  $(x^2 - 3x + 1) = 0$ .

$$(x^2 - 3x + 1) = 0$$

$$\implies x = \frac{3 \pm \sqrt{5}}{2}$$

Observe that  $\frac{3-\sqrt{5}}{2}<2$  and  $\frac{3+\sqrt{5}}{2}>2$ . Thus, we reject  $x=\frac{3-\sqrt{5}}{2}$  and take  $x=\frac{3+\sqrt{5}}{2}$ .

$$x = \frac{3 + \sqrt{5}}{2}$$

Consider  $f(x) = f^{-1}(x)$ . Applying f on both sides of the equation, we have  $f^2(x) = f(x)$ . Since  $x = \frac{3 + \sqrt{5}}{2}$  satisfies  $f^2(x) = f(x)$ , it also satisfies  $f(x) = f^{-1}(x)$ .

#### Part (b)

### Subpart (i)

$$g(4) = 2 + g(2)$$

$$= 2 + 2 + g(1)$$

$$= 2 + 2 + 1 + g(0)$$

$$= 2 + 2 + 1 + 1$$

$$= 6$$

$$g(7) = 1 + g(6)$$

$$= 1 + 2 + g(3)$$

$$= 1 + 2 + 1 + g(2)$$

$$= 1 + 2 + 1 + (g(4) - 2)$$

$$= 1 + 2 + 1 + 6 - 2$$

$$= 8$$

$$g(12) = 2 + g(6)$$

$$= 2 + (g(7) - 1)$$

$$= 2 + 8 - 1$$

$$= 9$$

$$g(4) = 6, g(7) = 8, g(12) = 9$$

# Subpart (ii)

Consider g(5) and g(6).

$$g(5) = 1 + g(4)$$

$$= 1 + 6$$

$$= 7$$

$$g(6) = g(7) - 1$$

$$= 8 - 1$$

$$= 7$$

Since g(5) = g(6), but  $5 \neq 6$ , g is not one-one. Hence,  $g^{-1}$  does not exist.

g does not have an inverse.
